

RAJESH THANERU

Senior QA Engineer

9866125609 • thanerurajesh@gmail.com • linkedin.com/in/rajeshthaneru • Andhra Pradesh, India

PROFESSIONAL SUMMARY

Delivery-focused QA professional with 7.8 years of experience owning end-to-end functional test execution across complex, multi-tier SaaS platforms. Proven track record of managing test strategy, planning, defect triage, status reporting, and UAT coordination across multiple concurrent workstreams — partnering directly with business, technology, and integration teams to surface risks early and drive predictable delivery outcomes. Experienced in front-office, back-office, and data workstream testing with deep proficiency in defect lifecycle governance, compliance-driven workflow validation, and cross-functional stakeholder communication. Hands-on background in Agile delivery models with structured reporting discipline aligned to program milestones.

CORE COMPETENCIES

Test Leadership: End-to-End Test Execution Ownership • Test Strategy & Planning • Functional Test Scheduling • Milestone Alignment

Defect Management: Defect Triage Leadership • JIRA • SLA Governance • Severity-Priority Alignment • Audit-Ready Reporting

Testing Disciplines: Functional • UAT • Regression • Exploratory • API Testing • Cross-Browser • Risk-Based

Stakeholder Engagement: Status Reporting • UAT Sign-Off Coordination • Risk Escalation • Business & Tech Partner Collaboration

Tools & Platforms: JIRA • HP ALM • Postman • Insomnia • SQL • JMeter • Selenium (Python) • Git

Delivery Models: Agile / Scrum • STLC / SDLC • Sprint Ceremonies

Domain Knowledge: Real Estate SaaS (Front / Back Office / Data) • Commission & Fee Structures • Role-Based Access • Compliance Workflows

PROFESSIONAL EXPERIENCE

Senior QA Engineer | [IntelliAgent \(formerly Naberly Technologies\)](#) | Jul 2020 – Nov 2025

Real Estate SaaS — Fathom Platform

Test Execution Ownership & Delivery Management

- Owned end-to-end functional test execution for 6+ major releases across concurrent workstreams — Agent Plans, Revenue Share, Team Management, Onboarding, and Fee Configuration — acting as the single point of QA accountability from requirements intake through UAT readiness.
- Developed and maintained detailed test plans, test schedules, and traceability matrices aligned to business rule requirements and sprint milestones — covering 500+ test scenarios across plan types and eligibility conditions.
- Managed day-to-day execution across test phases (functional, regression, UAT, smoke, exploratory) — tracking progress against milestones and adjusting scope based on risk and defect trends.
- Coordinated closely with business, technology, and integration teams to confirm functional scope, data readiness, and environment stability before each test cycle — preventing downstream execution delays.
- Partnered with Automation team to identify regression candidates; initiated Selenium + Python framework (Page Object Model + pytest) for repeatable regression coverage.
- Supported System Performance team by aligning functional test windows with performance test activities to avoid environment conflicts and ensure integrated coverage.

Defect Triage Leadership & Governance

- Led defect triage forums at the functional level — partnering with business, technology, and integration teams to drive prioritization, resolution ownership, and timely closure across test phases.
- Managed full defect lifecycle in JIRA and TestRail: logging, severity/priority alignment, triage, aging tracking, reopen governance, and audit-ready closure documentation — measurably reducing fix-cycle turnaround by eliminating back-and-forth clarification.

- Ensured defects were risk-assessed and impact-aware with clear traceability to business processes and test scenarios — enabling fast, confident triage decisions.
- Proactively identified defect trends and systemic quality risks; escalated to delivery leadership with clear mitigation recommendations before they became release blockers.
- Maintained strong governance over defect SLAs, leakage rates, and reopen ratios — producing transparent defect dashboards for Test Manager and program leadership throughout each release cycle.

Status Reporting & Stakeholder Communication

- Produced structured test status reports covering execution progress, defect aging, leakage rates, risk flags, and UAT readiness — keeping technical and business stakeholders aligned without overloading them with detail.
- Participated in Agile sprint ceremonies — providing QA sign-off, flagging scope risks early, and constructively pushing back on decisions that posed quality or delivery risk.
- Coordinated UAT with business stakeholders, facilitated sign-off activities, and validated go-live readiness across multiple release cycles.

Functional & Data Validation

- Validated complex end-to-end workflows: Plan Transitions (Fathom One → Share → Max), Revenue Share calculations, Commercial Cap Rollovers, Team Assistant Plans, Fee Configurations, Payment Modal behaviors, and Onboarding Permission logic.
- Executed ETL/data validation using SQL queries across Black, UAT, and Test environments — cross-verifying front-end displays against backend data to catch 30+ data mismatch defects invisible from the UI alone.
- Wrote and executed 500+ API test cases in Postman against REST/SOAP endpoints to validate business rule processing and data integrity at the service layer.
- Performed role-based access control testing, user profile validation, and third-party partner visibility verification — ensuring regulatory-grade accuracy in what each user role could view, create, and modify.
- Executed cross-browser and mobile compatibility testing (Chrome, Edge, Android, iOS) — documenting UI inconsistencies affecting ~20% of users before production release.

Team Development & Continuous Improvement

- Mentored two junior QA engineers from manual-only to automation contributors within two sprints — building team capability while maintaining release timelines.
- Contributed to continuous improvement of testing approaches, reusable test assets, and execution models across functional test cycles.
- Played an advisory role on projects facing challenges — providing direction, solution support, and stabilization guidance.

Key Projects Delivered

- Fathom Share Plan — Agent, Spouse, Mentor/Mentee, Team Lead/Member flows; 150+ scenarios with cross-role dependency mapping.
- Commercial Cap Rollover — Edge-case design for cap resets, date boundaries, mid-cycle transitions.
- Team Assistant Plan — Eligibility rules, fee deduction logic, rollover validation across UAT.
- Unpaid Fees Display — Fee display logic validation with DB cross-verification and regression across agent plan types.
- Welcome Email Logic & Onboarding Permission — Permission-based trigger validation and onboarding gate condition testing.

Telecommunication Engineer – Acceptance Testing | Centre for Development of Telematics (C-DOT) | Jul 2019 – Mar 2020

- Executed structured acceptance testing on core network equipment and CMS configurations against defined acceptance criteria — building disciplined compliance-style test execution habits.
- Validated IP assignments, gateway configurations, and signaling server setups against regulatory and technical specifications.

Associate Consultant – QA & Support | Logic Information Systems | Dec 2017 – Jul 2019

- Prepared test cases from customer and regulatory requirements; tracked every defect from opening through closure in collaboration with business analysts.

- Ran SQL queries to validate data in target databases; used PuTTY-based log analysis to surface integration failures not visible from the front end.
- Managed SLA-based support tickets, patches, and maintenance releases — building accountability habits around delivery timelines and documentation quality.

EDUCATION

Bachelor of Engineering — Electronics & Communication Engineering | Sreenivasa Institute of Technology and Management Studies | 2013–2017

ADDITIONAL INFORMATION

- Freelance QA (uTest Rated Tester): Achieved Rated Tester status delivering high-quality bug reports for global clients across web and mobile platforms — demonstrating independent execution in multi-vendor, global testing environments.
- Automation Portfolio: Selenium + Python automation project (Page Object Model, pytest, conftest) targeting real estate platform workflows — available on GitHub.
- Currently Learning: ETL/data pipeline testing (SQL reconciliation, source-to-target validation, SCD patterns), Playwright, Cypress, CI/CD pipeline integration.
- Work Style: Strong execution mindset; experienced delivering quality in high-dependency, multi-team environments with structured reporting and proactive stakeholder communication.
